

- > It is same as before that we learned on logistic regression.
- > This trick will pick a point and ask is it is in the perfect position.
- > If it is, nothing will happen
- > If it is no, then the point pull the line toward that point so that the point gets in the perfect region

-> Everything is same as logistic regression here.

-> At the end we will get the equation: $w_n = w_0 + n(y_i - \hat{y}_i)x_i$
